

CLIMATOLOGICAL DATA FOR MAY, 1913.

DISTRICT NO. 10, GREAT BASIN.

ALFRED H. THIESSEN, Section Director.

GENERAL SUMMARY.

Favorable conditions prevailed generally throughout the whole month of May, 1913. There was a small excess in temperatures, which was beneficial, and a deficiency in precipitation, which, however, was not harmful. In the Utah area there were some frosts during the forepart of the month and ice occurred in the mountain districts. The frost did a great deal of damage, though several communities reported no losses.

The average number of rainy days was 3, clear days 14, partly cloudy days 10, and cloudy days 7.

TEMPERATURE.

For the district as a whole the temperature for the month of May averaged 55.9° , which is 1.3° below normal. The local mean temperatures ranged from 43.7° at Woodruff, Utah, to 71° at Jean, Nev., but the means at the majority of stations averaged between 50° and 60° . Almost all stations reported averages above normal. The lowest means occurred in the Idaho and Wyoming areas, and the highest in the Utah and southern portion of the Nevada areas.

Deficiencies in temperature occurred at a few scattered stations both in the Utah and Nevada areas, while excesses which were not large were the rule. The greatest local deficiency was 3.9° at Woodruff, Utah, where the mean was 43.7° ; and the greatest excess was 5.6° at Burns, Oreg., where the mean was 54.4° .

The forepart of the month was cool, while the latter part was warm. The lowest temperatures occurred on the 1st, 2d, and 3d, and on those days ranged from 5° at Tecoma, Nev., to 35° at Midlake, Utah, and Lahontan, Nev. After the 3d a change to warmer set in, but the temperature rose slowly until the beginning of the last decade, which was the warmest of the month, the temperatures averaging above normal.

The highest temperatures occurred on various dates from the 22d to the end of the month, but generally on the 24th, 25th, and 26th. The highest temperatures for the month in the respective States or parts of States were: 86° on the 28th at Cokeville, Wyo.; 92° on the 31st at Grace, Idaho; 107° on the 26th at Midvale, Utah; 98° on the 22d at Jean, Nev.; 89° on the 26th at Burns, Oreg., and 74° on the 16th at Bridgeport and on the 24th at Tahoe, Cal.

PRECIPITATION.

The precipitation for the district averaged 0.96 inch, which is 0.38 inch below normal. The precipitation chart shows quite heavy amounts in the northern portion of the Utah and western portion of the Nevada area, but in the former section all the amounts were below normal.

In the Nevada area the rainfall for the month was the heaviest May rainfall since 1906. In the Utah area only one-half the normal fell. While no droughty conditions developed, moisture was badly needed at the close of the month, the creeks having fallen rapidly despite the warm weather's effect on the mountain snow after the 15th.

Light showers fell on the 1st and 2d in the extreme northeastern portion of the district. Showers began again on the 6th in the Oregon and California areas, becoming somewhat general on the 13th in Utah, and again on the 18th with scattered showers on adjacent dates. In the Oregon, Nevada, and California areas, rain was heaviest during the last five days of the month, but light in other parts of the district. On the 27th thunderstorms occurred at many stations, and lightning struck the Government telephone and power line at Spanish Fork, Utah, doing damage to some electrical equipment, and a team was reported killed by lightning a mile distant from that place.

SNOW SURVEY OF BIG COTTONWOOD WATERSHED.

By H. K. BURTON, Assistant Engineer, assisted by W. A. RICHMOND.

During the month of April, 1913, a snow survey was made of Big Cottonwood Canyon. The party, consisting of five men and a team, with complete equipment for two parties, left the city April 23, returning May 3.

The objects of the survey were to determine the depth and density of the snow in the main forks of the canyon, the approximate surface supply at the beginning of the melting season, the physical condition of the snow, and the condition of the ground surface beneath the snow layer.

The information thus obtained will be of relative value for this year only, as we have but the survey of 1912 for comparison, and the conditions this year differ greatly from what were found then.

The observations should be continued for several years in order to get data for the reliable calculation of the available water supply.

From the first camp at Maxfield Lodge trips were made to the head of Broads Fork; Mill B, South Fork; and Mineral Fork. At frequent intervals soundings of depth were taken by means of a graduated steel-pointed rod.

At representative points measurements were made of the depth and density of the snow by the use of graduated galvanized-iron tubes, one set being 2 inches and the other 3 inches in diameter. The density determination consisted of weighing the tube and the inclosed core of snow on a spring balance so graduated that the equivalent in inches of water could be read off directly.

TABLE 1.—Climatological data for May, 1913. District No. 10, Great Basin.

*, †, ‡, etc., indicate respectively 1, 2, 3, etc., days missing from the record.

** Temperature extremes are from observed readings of the dry bulb; means are computed from observed readings.

† Also on other dates.

T. Precipitation is less than 0.01 inch rain or melted snow.

TABLE 2.—*Daily precipitation for May, 1913. District No. 10, Great Basin.*

TABLE 2.—*Daily precipitation for May, 1913. District No. 10, Great Basin—Continued.*

* Precipitation included in that of the next measurement.

† Separate dates of falls not recorded.

Precipitation for the 24 hours ending on the morning when it is measured.

T. Precipitation is less than 0.01 inch rain or melted snow.
